

# HISTAMINE & PHARMACOLOGICAL TREATMENT OF ALLERGY

**Ladislav Mirossay**

P. J. Šafárik University

Faculty of Medicine

Department of Pharmacology

Košice

# Allergy

- an inappropriate response of the body's immune system to **normally harmless** substances

(pollens, foods, house dust mite, pets, insect poisons, drugs...)

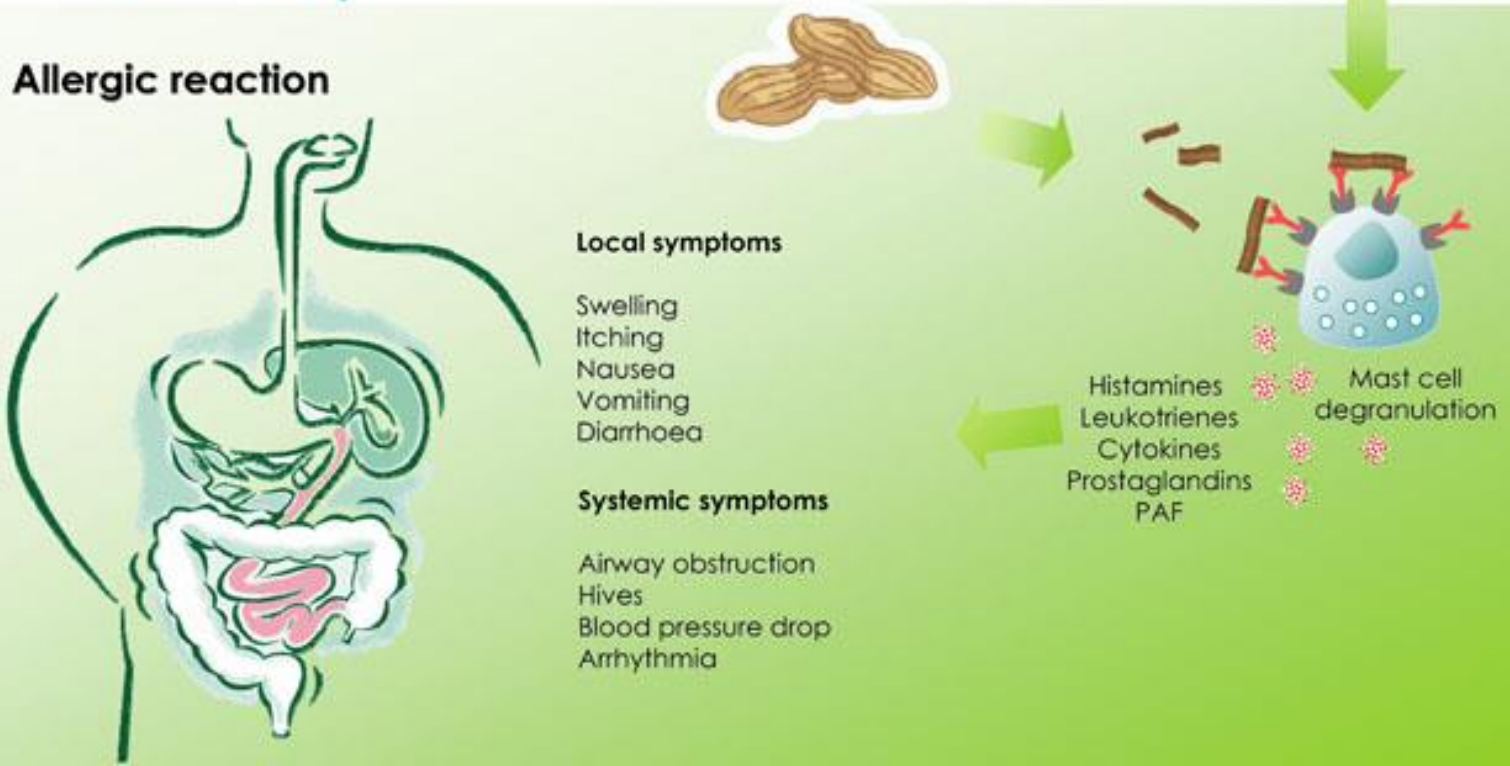

# Sensitisation & allergic reaction

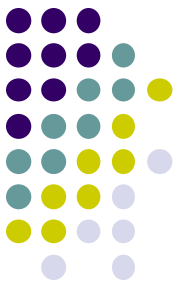

## Sensitisation

## Allergic reaction

# Crosslinking of the FcεRI via IgE-antigen complexes - degranulation

# Allergic reaction

## Degranulation processes

1. antigen
2. IgE antibody
3. **FcεRI receptor** (high-affinity IgE receptor)
4. preformed mediators (early-phase mediators)
5. granules
6. mast cell
7. newly formed mediators (late-phase mediators)

# Types of allergy mediators

# HISTAMINE

- hydrophilic vasoactive amine
- it is involved in:
  - ✚ local immune responses
  - ✚ regulation of physiological function in the gut
  - ✚ acting as a neurotransmitter
- it also triggers the inflammatory response

- it is derived from the amino acid *histidine* by decarboxylation (L-histidine decarboxylase)
- it is broken down by histamine-N-methyltransferase & diamine oxidase

# History of histamine

- *Adolf Windaus*
- ✚ **Nobel prize in chemistry 1928**
- ✚ discovered 7-dehydrocholesterol, precursor of vitamin D, & he showed that it is a steroid
- ✚ discovered that it is converted into the vitamin by the action of sunlight
- ✚ **discovered histamine**

1876-1959

# Histamine localization & release

- Localization:
  - + **mastocyte & bazophile** (granules) – bound to heparan sulfate & acidic protein
  - **Mastocyte & bazophile** - in various tissues - preferentially in:
    - + **respiratory system**
    - + **GIT**
    - + **skin**
  - Triggering factors for histamine release:
    - + **UV, allergenes (IgE) – type I.**
    - + **drugs: *morphine, codeine, tubocurarine***
    - + **inflammatory reaction**

# Histamine receptors

## Distribution

- **H<sub>1</sub>-receptors:**

- ✚ endothelium

- ✚ smooth muscles

(blood vessels, bronchial system, uterus, GIT)

- **H<sub>2</sub>-receptors:**

- ✚ gastric mucosa

- ✚ heart

- ✚ immune system

- **H<sub>3</sub>-receptors:**

- ✚ CNS

- **H<sub>4</sub>-receptors:**

- ✚ immune cells

# Histamine receptors

## Function

**H<sub>1</sub>**

### Smooth muscle:

- ↑↑ tone → contraction (bronchi, intestine, uterus)

### Blood vessels:

- endothelium NO release → vasodilatation
- endothelial cell slots opening → ↑↑ vascular permeability

### Sensitive nerve endings:

- itching

### CNS:

- ↑↑ vigilance

**H<sub>2</sub>**

### Stomach:

- ↑↑ HCl secretion

### Blood vessels:

- direct vasodilatation

### Heart:

- ↑↑ contraction force
- ↑↑ frequency
- arrhythmogenicity

**H<sub>3</sub>**

### CNS:

- ↓↓ of histamine release & other NTs

# Effects of histamine in CVS

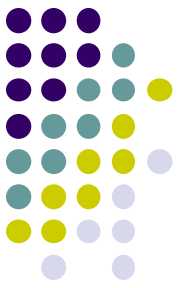

- **H<sub>1</sub>-receptors stimulation :**
  - ✚ vasodilation small arterioles & capillaries
  - ✚ blood vessel wall permeability increase
  - ✚ ↓ BP, reflex tachycardia, edema
  - ✚ **Lewis reaction** (intradermal histamine injection): → localized red macula (capillary dilation) → spreading of macula (arteriolar dilation - axonal reflex) → papular induction (localized edema)
- **H<sub>2</sub>-receptor stimulation in the heart:**
  - ✚ ↑↑ contractility
  - ✚ ↑↑ pacemaker activity

# Effect of histamine in smooth muscles & mucosa

- **Bronchial smooth muscle**
  - + **H<sub>1</sub>-receptor stimulation** ⇒ bronchoconstriction
- **GIT smooth muscle**
  - + **H<sub>1</sub>-receptor stimulation** ⇒ intestinal contraction; diarrhea in higher concentrations
- **Gastric mucosa**
  - + **parietal cell H<sub>2</sub>-receptor stimulation** ⇒ gastric acid secretion & pepsin activation

# Effect of histamine in other tissues

- **Uterus**

- **H<sub>1</sub>-receptor stimulation** ⇒ contraction

- **Nerve endings**

- **H<sub>1</sub>-receptor stimulation** ⇒ irritation

⇒ pain & itching (e.g. urtica in insect injury)

# Histamine inhibition

- **synthesis inhibition**
- ✚ **glucocorticoids**
- **release inhibition**
- ✚ **cromoglycate (nedocromil sodium)**
- **organ level inhibition**
- ✚ **adrenaline**
- (in anaphylaxis)
- **receptor level inhibition**
- ✚ **antihistaminics**

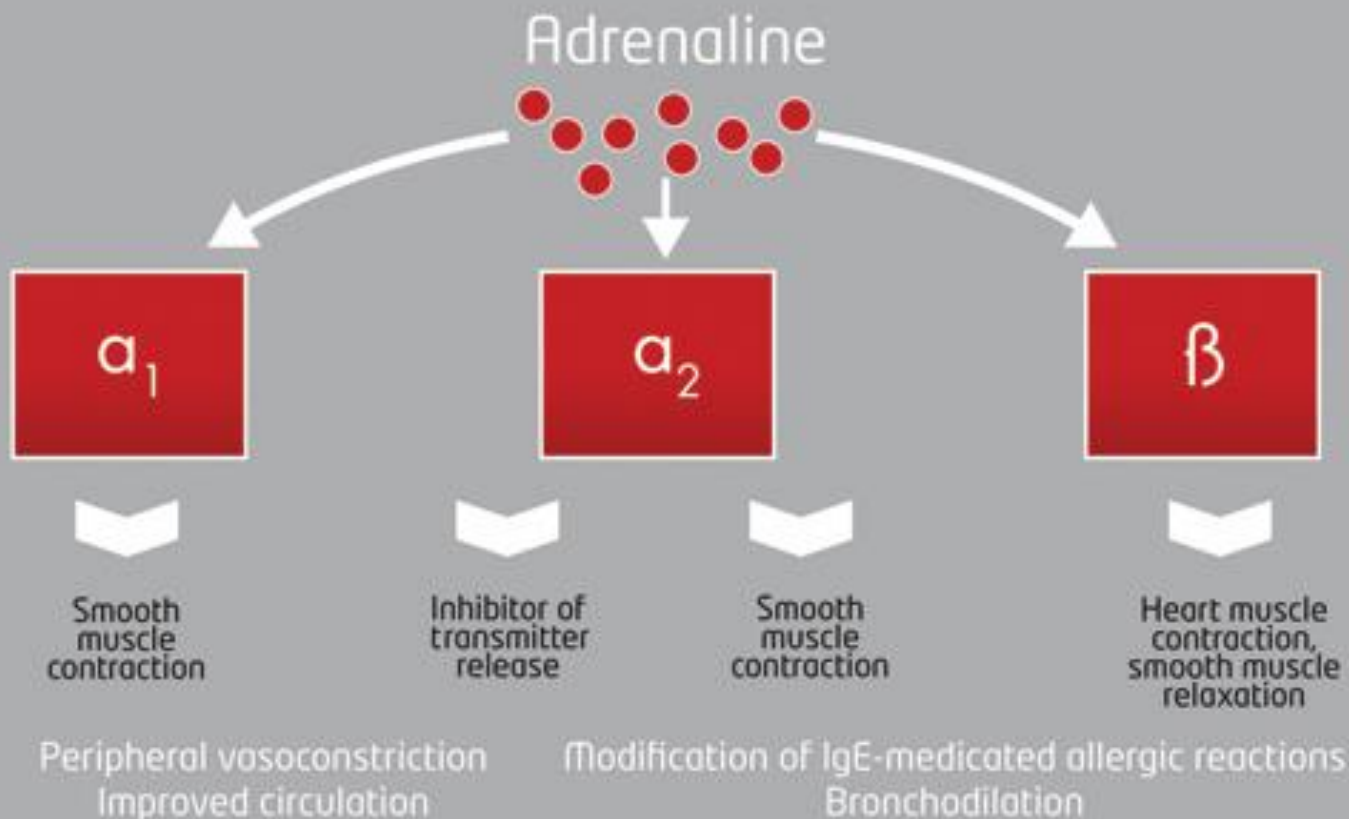

# Adrenaline

## Mechanisms in anaphylaxis

### What Does Adrenaline Do?

# *Adrenaline*

## Principal rules in anaphylaxis

- **Adrenaline is life saving & must be used promptly in anaphylaxis**
- Delaying the giving of adrenaline can result in deterioration & death
- using an adrenaline device is the **first line treatment for anaphylaxis**
- **IF IN DOUBT, GIVE ADRENALINE FIRST** & then call for help

# H<sub>1</sub>- ANTAGONISTS

## I. generation

- **Competitive antagonists – H<sub>1</sub> receptors**
- ✚ blood vessel response inhibition including ↑  
**permeability** (edema)

**!!! DO NOT AFFECT SHOCK SYMPTOMS !!!**

- ✚ **inhibition of CNS → interactions** (can be oposite in children - stimulation, excitation, clinically as seizures)
- ✚ **antiemetic & antivertiginous effect** (vomiting & vertigo)
- ✚ **antimuscarinic effects – ↓↓ mucosal secretion** (rhinitis treatment)

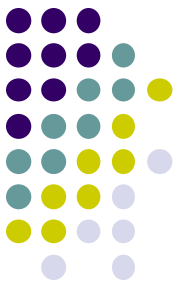

# First generation H<sub>1</sub>- antagonists

- **low specificity**
- some effects may be undesirable, others of therapeutic value (anticholinergic – drying of nasal mucosa; sedative effects - insomnia)

# H<sub>1</sub>- antagonists I. generation

## Pharmacokinetics

- **rapid GIT absorption**

(effect in 1/2 h)

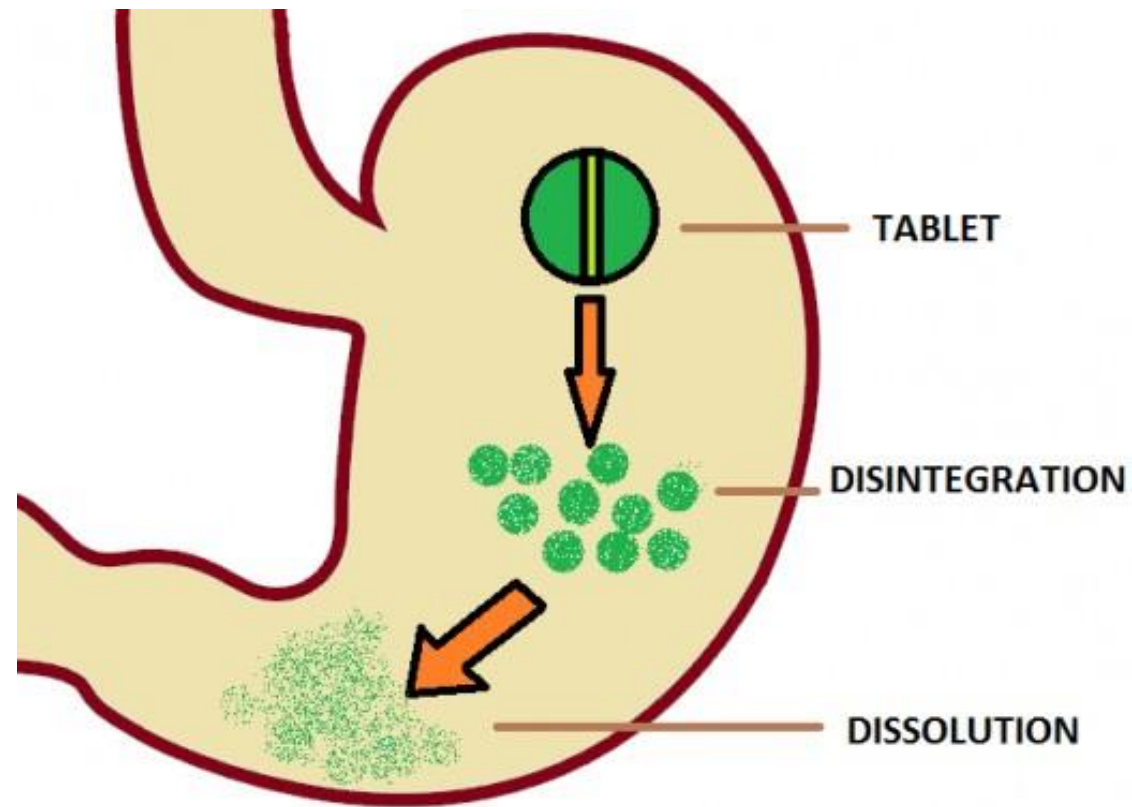

- **liver metabolism**

- **renal excretion**

- **newer I. generation drugs – longer  $t_{1/2}$**

(12-24 h)

- **prophylaxis**

# H<sub>1</sub>- antagonists I. generation

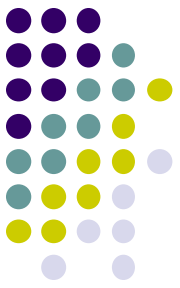

## Indications

- **symptomatic therapy of allergies** - allergic rhinitis (hay), urtica, Quincke edema, drug & food allergies
- **adjuvans in anaphylactic reactions therapy**
- **prophylaxis in desensitisation therapy**
- **pruritus of different origin** - allergic & nonallergic dermatoses, pruritus in infective diseases – (scarlatina, measles)
- **insect injuries**
- **kinetoses** - vertigo, tinnitus, morbus Meniere, migraine
- **nausea & vomiting of different ethiology** (except organic GIT disturbances)
- **insomnia**

# H<sub>1</sub>- antagonists I. generation

## Side effects

### ADVERSE EFFECT OF FIRST GENERATION H<sub>1</sub> ANTIHISTAMINES

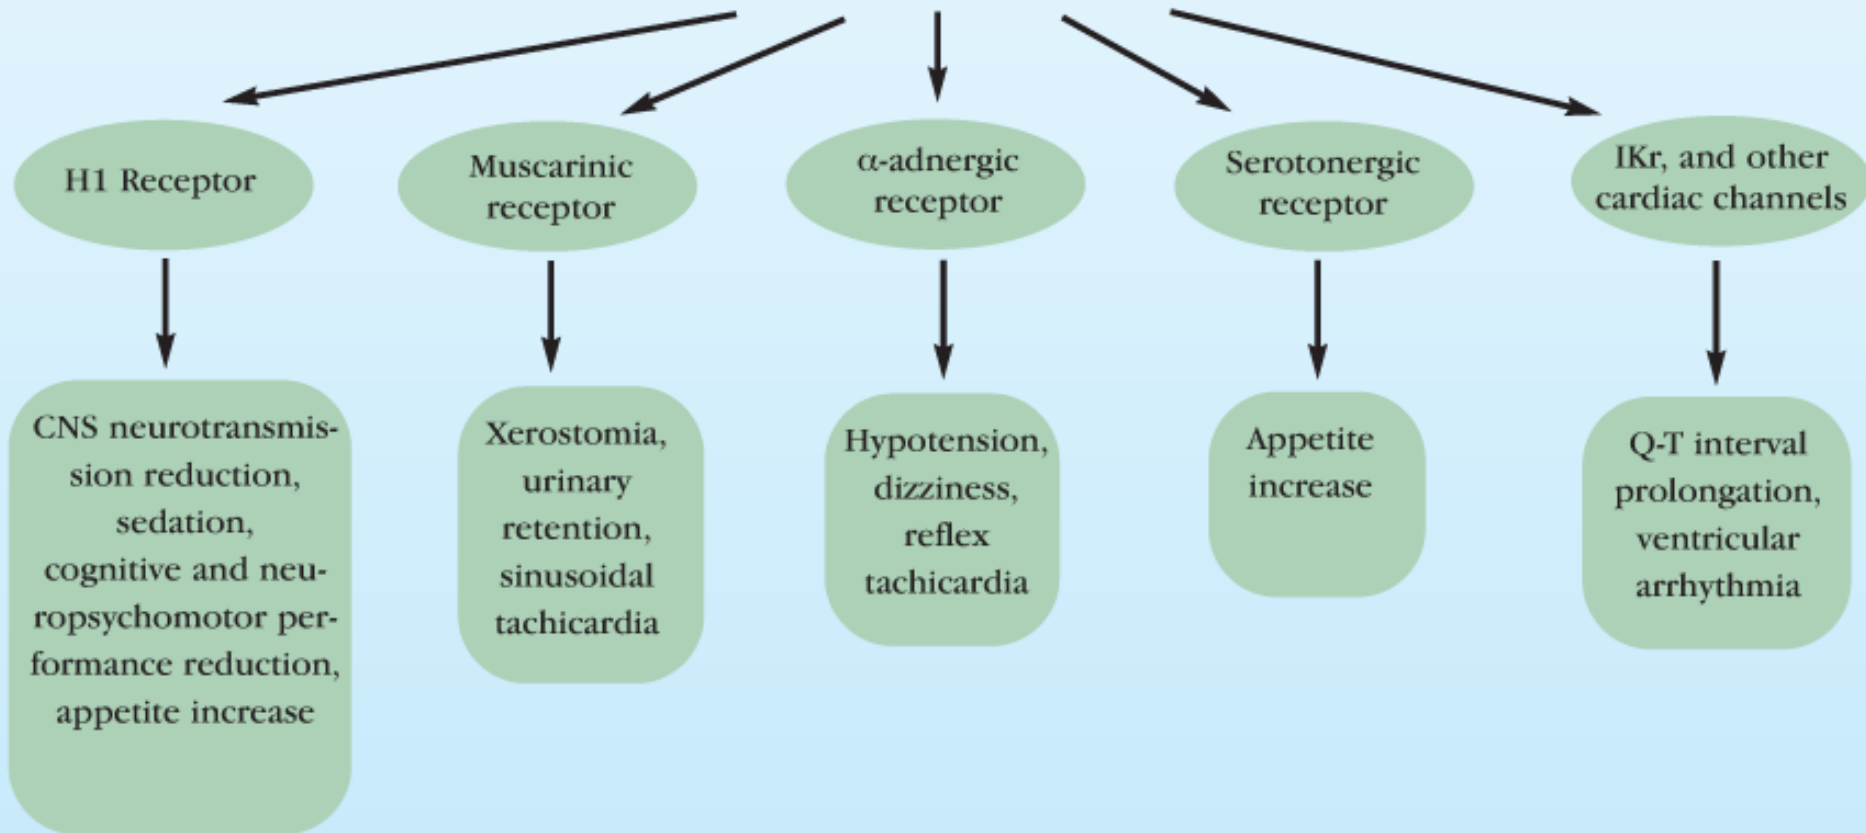

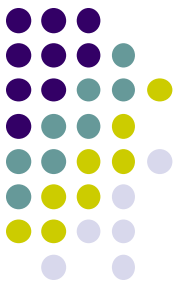

FIGURE 5: Symptoms and signs of the adverse effects of first-generation H<sub>1</sub> antihistamines

# H<sub>1</sub>- antagonists I. generation

## Representatives

Generic name	Trade name	Duration (h)	Sedation	Dose (mg)
<i>diphenhydramine</i>	-	6	±	50
<i>promethazine</i>	PROMETHAZINE PROTHAZINE	20	+++	10-20
<i>bisulepine</i>	DITHIADEN	7	+	2
<i>dimetinden</i>	FENISTIL	7	+	1-2
<i>clemastine</i>	TAVEGYL	12	±	1
<i>moxastine</i>	THEADRYL KINEDRYL	2	+	25

# H<sub>1</sub>- ANTAGONISTS

## II. generation

- minimal sedative effects
- prolonged H<sub>1</sub> - antagonist effects

Generic name	Trade name	Duration (h)	Sedation	Dose (mg)
<i>astemisol</i>	HISMANAL	24	0	10
<i>cetirizine</i>	ZYRTEC	24	0	10
<i>loratadine</i>	CLARITIN	24	0	10
<i>terfenadine</i>	SELDANE	12	0	60

# Cetirizine

## Effects & side effects

### Cetirizine (Zyrtec)

When allergies strike, Drippy and Sneezy are a sign of the times.

# H<sub>1</sub>- antagonists

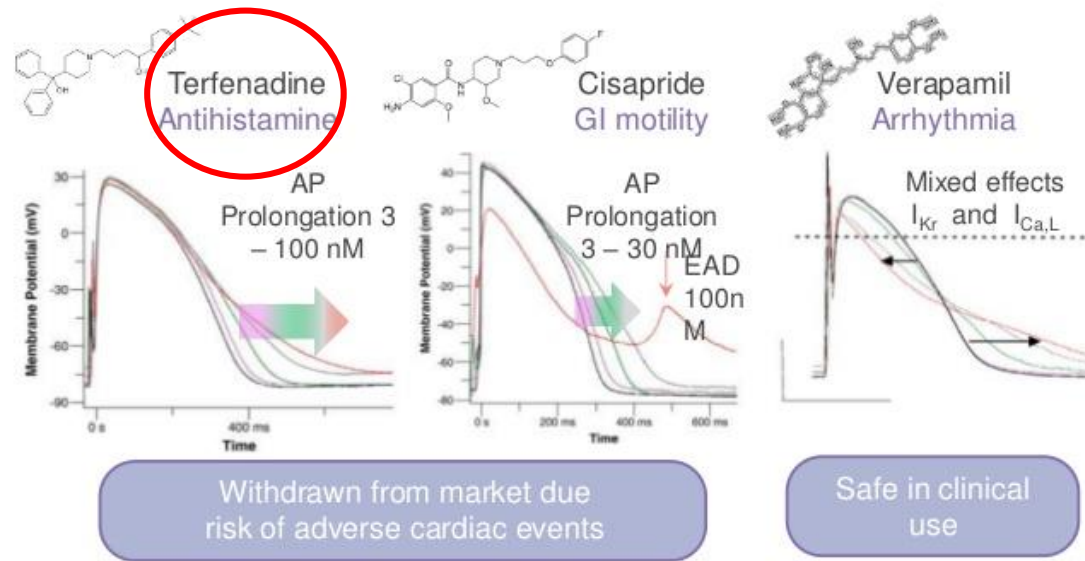

## II. generation

- *astemizole* & *terfenadine* were found to cause potentially **serious arrhythmias** (including death, cardiac arrest, torsades de pointes, & other ventricular arrhythmias), when plasma concentrations became elevated subsequent to:

- impaired metabolism or
- drug interaction (macrolides, antifungals)

Assessing pro-arrhythmic potential  
Whole cell patch clamp to assess cardiac AP modulation

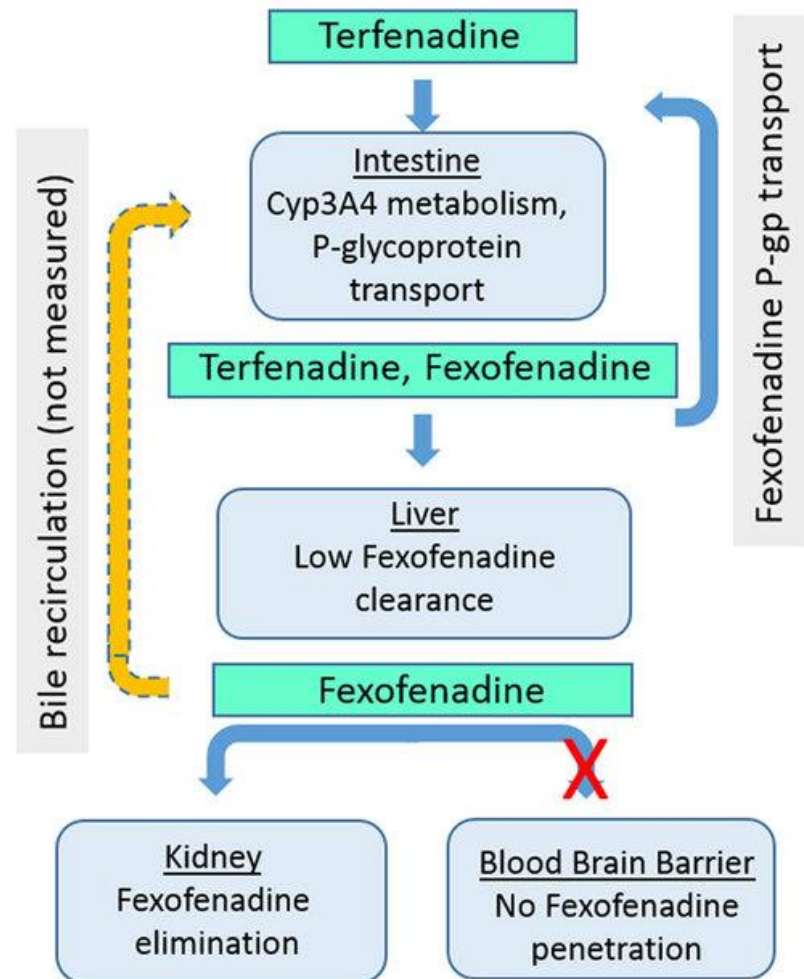

# H<sub>1</sub>- ANTAGONISTS

## III. generation

- they are even an **active enantiomer** or **metabolite** of a II. generation drug designed to have:
  - ❖ **↑ efficacy &**
  - ❖ **↓ side effects**
- they are **devoid of cardiac toxicity**

### Terfenadine Transport and Metabolism

# H<sub>1</sub>- antagonists

## III. generation

- minimal sedative effects
- prolonged H<sub>1</sub> - antagonist effects
- no cardiovascular side effects

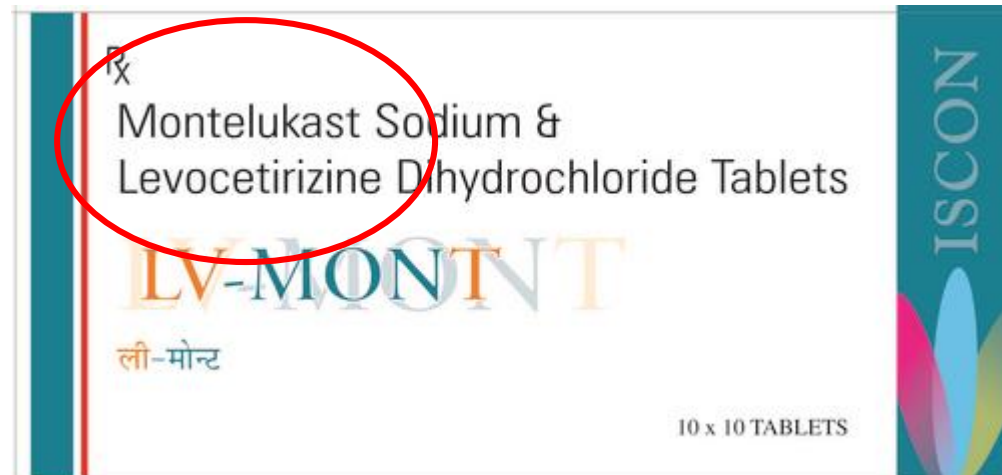

Generic name	Trade name	Duration (h)	Sedation	Dose (mg)
<i>levocetirizine</i>	LEVOCETIRIZINE ACTAVIS	24	0	5
<i>desloratadine</i>	DESLORATADINE ACTAVIS	24	0	5
<i>fexofenadine</i>	FIXIT 120	12	0	120

# H<sub>1</sub>- antagonists

## III. generation

- **Levocetirizine**
- an active enantiomer of *cetirizine* (more effective with fewer adverse effects)
- not metabolized & is likely to be safer than other drugs (due to a lack of possible drug interactions)
- it does not cross BBB & does not cause significant drowsiness
- it has been shown to reduce asthma attacks by 70% in children
- can be combined with LT-receptor antagonist

# Third generation H<sub>1</sub>-receptor antagonists

## Desloratadine (Clarinet)

- It is the active metabolite of Loratadine
- Even though it is thought to be more effective, there is no concrete evidence to prove this

## Fexofenadine (Allegra)

- It was developed as an alternative to Terfenadine
- Fexofenadine was proven to be more effective and safe

# H<sub>3</sub> – ANTAGONISTS

## Pharmacodynamics

### *Betahistine*

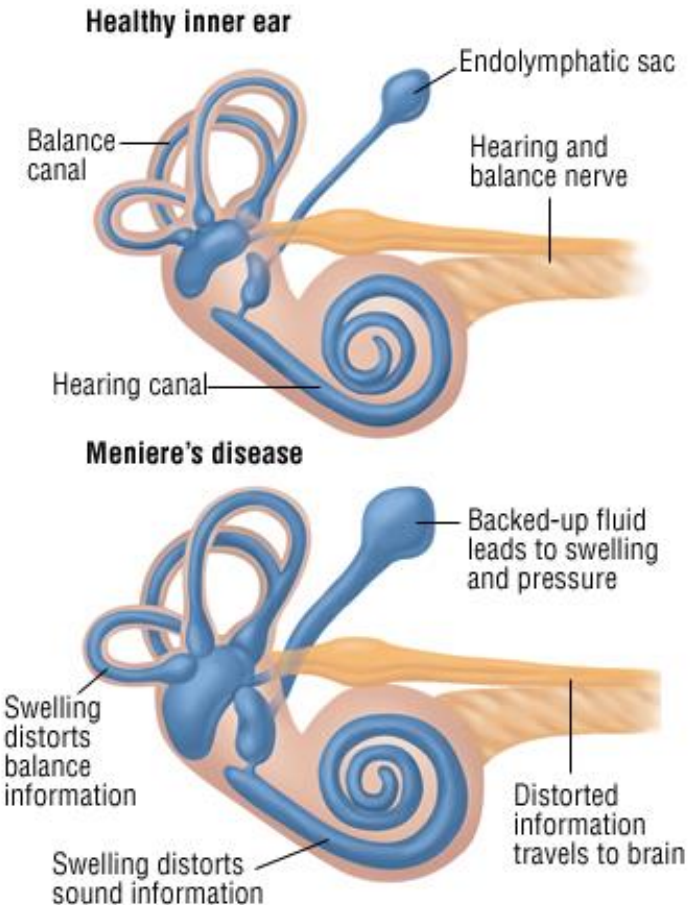

- **antagonist effects at H<sub>3</sub> - receptors** → ↑↑ the levels of neurotransmitters released from the nerve endings (*histamine, acetylcholine, norepinephrine, serotonin, & GABA*)
- **direct agonist effect on H<sub>1</sub> - receptors** (located on blood vessels in the inner ear) → dilates the blood vessels (within the inner ear) → can relieve pressure from excess fluid & act on the smooth muscle

# Betahistine

## Indications

- it is used to:
  - balance disorders or
  - to alleviate symptoms associated with **Ménière's disease** (defective absorption in endolymphatic sac,...):
    - ❖ vertigo
    - ❖ tinnitus
    - ❖ the loss of hearing
    - ❖ nausea & vomiting, reactions to food
    - ❖ mental disorientation
    - ❖ mood swings
    - ❖ photosensitivity
    - ❖ extreme fatigue
    - ❖ cold sweats, palpitations...

# Antiemetics

## Antiserotonic drugs

**Ladislav Mirossay**

P. J. Šafárik University  
Faculty of Medicine  
Department of Pharmacology  
Košice

**Nausea:** Simona D'Auria 2005-2006

# Nausea & vomiting

- **nerve ending stimulation** – stomach & duodenum
- **vagus nerve stimulation** in pharynx
- **drugs** (antineoplastics), **endogenous emetogenic substances** (radiation damage), **infections**
- **visceral sensory nerves stimulate** (testes or uterus damage)
- **↑ intracranial pressure**
- **emotional & psychological factors, odours**
- **endocrine factors** (pregnancy) ⇒ increased estrogen concentration in chemoreceptive zone
- **migraine**

# Neurotransmitters involved in nausea & vomiting

- *acetylcholine*
- *norepinephrine*
- *dopamine*
- *serotonin*
- *histamine*
- *glutamate*
- *GABA*
- *ATP*
- *substance P*
- *endorphins*

## Antiemetics

Vomiting :The act of vomiting and the sensation of nausea that accompanies it are protective reflexes that serve to rid the stomach and intestine of toxic substances and prevent their further ingestion

# Antiemetic drugs

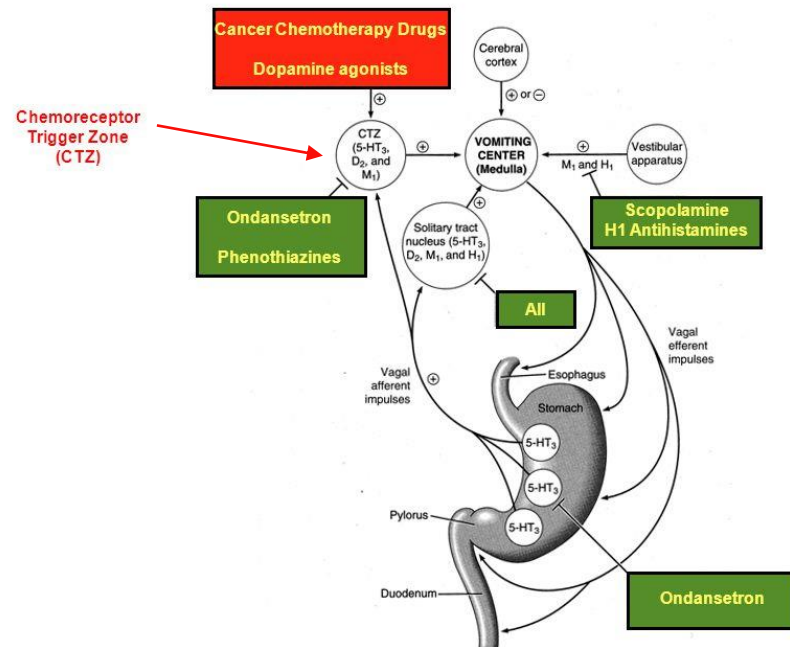

## Based on receptor antagonism

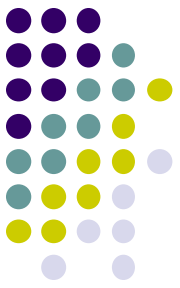

H <sub>1</sub>	M <sub>1</sub> , M <sub>3</sub>	D <sub>2</sub>	5-HT <sub>3</sub>	NK1
<i>promethazine</i>	<i>scopolamine</i>	<i>phenothiazines</i> <i>metoclopramide</i> <i>domperidone</i>	<i>setrons</i>	<i>aprepitant</i> <i>fosaprepitant</i>

- drugs which assist to **suppress emesis**
- successful therapy involves **blocking one or more receptors** for neurotransmitters involved in emesis regulation

### Antiemetic Therapeutic Sites - Summary

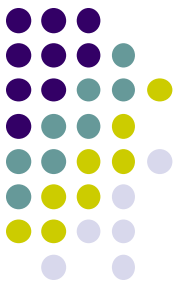

# H<sub>1</sub>-receptor antagonists as antiemetics

- *promethazine*,  
*diphenhydramine* –  
Meniere's disease
- *diphenhydramine*,  
*moxastine* – kinetosis
- prevention
- maximal antiemetic  
effect - **4 h after  
application** (duration 24 h)

# M<sub>1</sub> - receptor antagonists as antiemetics

- ***scopolamine***
- **antagonist of M<sub>1</sub>-receptors in cortex & pons**
- **antagonist of H<sub>1</sub>-receptors in hypothalamus & vomiting center**
- **suppresses also NA-system** (improved adaptation to vestibular stimulation)
- **transdermal application (patch)**
- **kinetosis, postoperative nausea & vomiting (PONV)**
- **4 h onset of action** (should be placed the night before in patients with ↑ risk of PONV)

# D - receptor antagonists as antiemetics

- **phenothiazines** (*chlorpromazine, prochlorperazine*)

- ***thiethylperazine*** – only as antiemetic

(in chemoreceptive zone)

- nausea & vomiting also in:

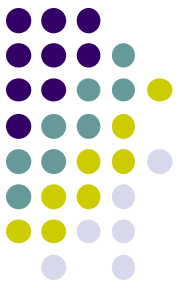

- uremia
- radiation
- kinetosis
- acute viral gastroenteritis
- PONV
- antineoplastic chemotherapy
- hyperemesis gravidarum

(*tiethylperazine*)

# D - receptor antagonists as antiemetics

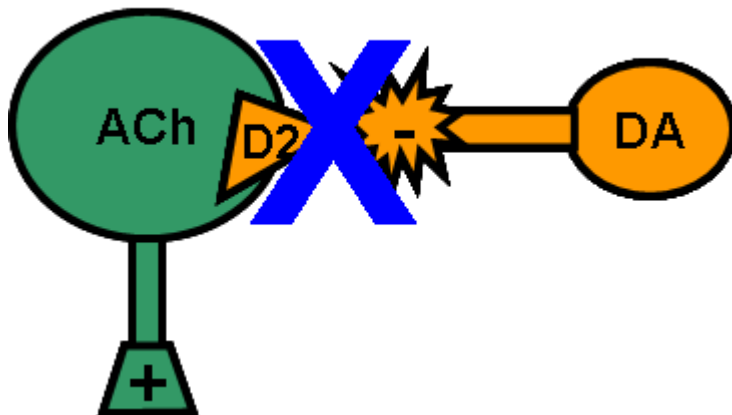

# Metoclopramide

## Mechanism of action

- ↓↓ gastric smooth muscle relaxation produced by **dopamine** → therefore ↑↑ cholinergic response of the GI smooth muscle

- it accelerates intestinal transit & gastric emptying (by preventing relaxation of gastric body & increasing the phasic activity of antrum)
- this is accompanied by relaxation of the upper small intestine (resulting in an improved coordination between the body & antrum of the stomach & the upper small intestine)

# *Metoclopramide*

## Additional actions

- it also ↓ reflux into the esophagus  
(by ↑ the resting pressure of the lower esophageal sphincter)
- dopamine antagonist action raises the threshold of activity in the chemoreceptor trigger zone & ↓ the input from afferent visceral nerves

# *Metoclopramide*

## Indications

### Adults:

- **short time** (max. 5 days):  
**prevention & therapy  
of nausea & vomiting**
- ✚ migraine
- ✚ uremia
- ✚ radiation
- ✚ chemotherapy
- ✚ acute viral gastroenteritis

### Children:

- therapy of **post-operative nausea & vomiting** (i.v. only)
- prevention of **delayed nausea & vomiting** after **chemotherapy** (oral or i.v.)

# *Metoclopramide*

## Application

- **short-time treatment** in recommended doses & intervals to **minimize neurologic, cardiovascular & other side effects**
- i.v. bolus – slow (3 min) –same reasons
- **contraidicated in children up to 1 year – risk of:**
  - **neurologic reactions**
  - **methemoglobinemia**

# *Metoclopramide*

## Side effects

- **neurologic:**

- extrapyramidal symptoms
- irreversible tardive dyskinesia

- **↑ risk:**

- high doses
- long-term therapy
- children

- **cardiovascular:**

- hypotension
- hypertension
- tachycardia

- **↑ risk:**

- i.v.
- elderly patients
- arrhythmias

# Domperidone

## Indications

- ✚ in patients with Parkinson's disease – prevention of vomiting in **apomorphine** treatment (unlike *metoclopramide*, it does not cross the BBB)
- ✚ gastroparesis (delayed gastric emptying)
- ✚ paediatric gastrooesophageal reflux

Do not confound with

# 5-HT<sub>3</sub> receptors in vomiting

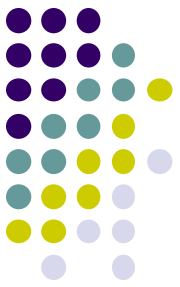

- *5-HT* is released by the enterochromaffin cells of the small intestine in **response to chemotherapeutic agents**
- 5-HT<sub>3</sub> receptors are present in several critical sites **involved in emesis** (vagal afferents, the solitary tract nucleus, the area postrema)
- the highest concentration of 5-HT<sub>3</sub> receptors in the CNS ⇒
  - **solitary tract nucleus &**
  - **chemoreceptor trigger zone**
- 5-HT<sub>3</sub> antagonists may also suppress vomiting & nausea by acting at these sites

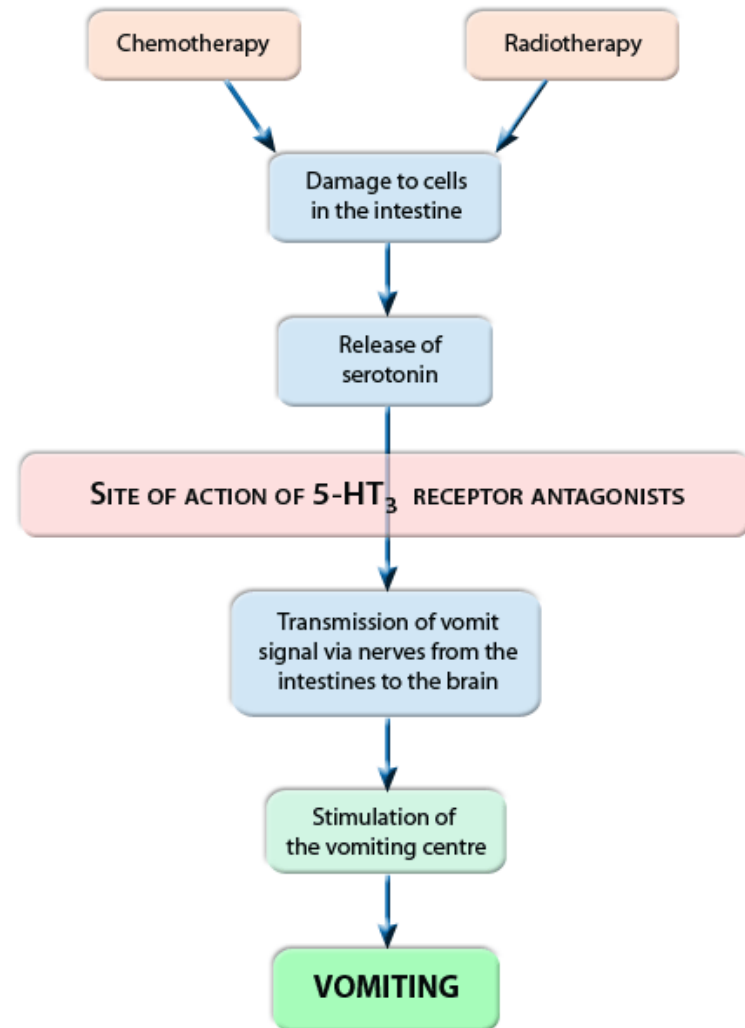

# 5-HT<sub>3</sub>- receptor antagonists

## Setrons

- **ondansetron, granisetron, tropisetron, palonosetron**
- ✚ **nausea & vomiting ⇒ chemotherapy**
- they may be **given alone** or **with a:**
  - **glucocorticoid** (*dexamethasone*)
  - **NK<sub>1</sub> receptor antagonist** (*aprepitant*)
- the most common side effects: constipation or diarrhea, headache, dizziness

# *Neurokinin type 1 (NK1)* receptors antagonist

## *aprepitant*

- blocks substance P from binding to NK 1-receptor
- broader spectrum & activity in delayed emesis
- augments the antiemetic activity of **5-HT<sub>3</sub> receptor antagonists & dexamethasone**
- inhibits both acute & delayed **chemotherapy-induced vomiting**
- good safety profile, high cost of the drug

# Corticosteroids

**Corticosteroids** have antiemetic properties

Mechanism of action:

- possibly by suppressing peritumoral inflammation & prostaglandin production

Use:

- to **enhance efficacy of 5-HT<sub>3</sub>-receptor antagonists** in the treatment of **chemotherapy-induced vomiting**

# ***Benzodiazepines***

Use:

- *benzodiazepines* such as ***diazepam*** are used prior to the initiation of chemotherapy to reduce anticipatory vomiting or vomiting caused by **anxiety**

**I CAN'T  
KEEP CALM  
BECAUSE  
I HAVE  
ANXIETY**

# SEROTONIN

## (5-hydroxytryptamine, 5-HT)

- synthesized from **tryptophan**
- rapidly metabolised
- localization:
  - + **GIT**
  - + **thrombocytes**
  - + **bronchial system**
  - + **NS**

The serotonergic system consists of ascending axons from cell bodies in the raphe nuclei

# History of serotonin

## 5-HT

- *Dr. Erspamer* first detected serotonin in the GIT in the 1930's, and called it "**enteramine**,"
- it was isolated in 1948, when *Drs. Page, Green, & Rapport* called it "**serotonin**", identifying it as an agent that affected blood vessels
- it was identified in the brain in the 1950's
- serotonin system is widespread throughout the body
- it has far more implications than just effects of vasculature
- "*serotonin*" was the name that stuck, pharmacologists prefer **5-hydroxytryptamine**

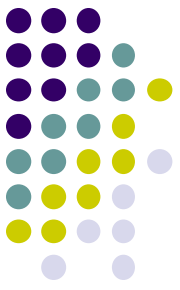

Irvine Page, M.D. (left)

Dr. Arta Green, team member,  
in front of machine used  
to isolate serotonin

# Effects of 5-HT in CNS

- sleep influence
- thermoregulation
- mood
- aging
- anxiety
- circadian rhythms
- eating disorders
- bowel problems
- migraine
- nausea
- premature ejaculation
- pain
- drug abuse
- vasodilation/vasoconstriction (BP)
- memory

...& the list goes on

# Effects of 5-HT in other tissues

- **CVS**

- ✚ **vasoconstriction** – lungs, kidneys

(direct effect in vessel wall)

- ✚ **vasodilation** - skeletal muscle, heart

(NO-mediated)

- **GIT**

- ✚ **smooth muscle tone** - motility stimulation

- **Bronchi**

- ✚ **smooth muscle tone** - constriction

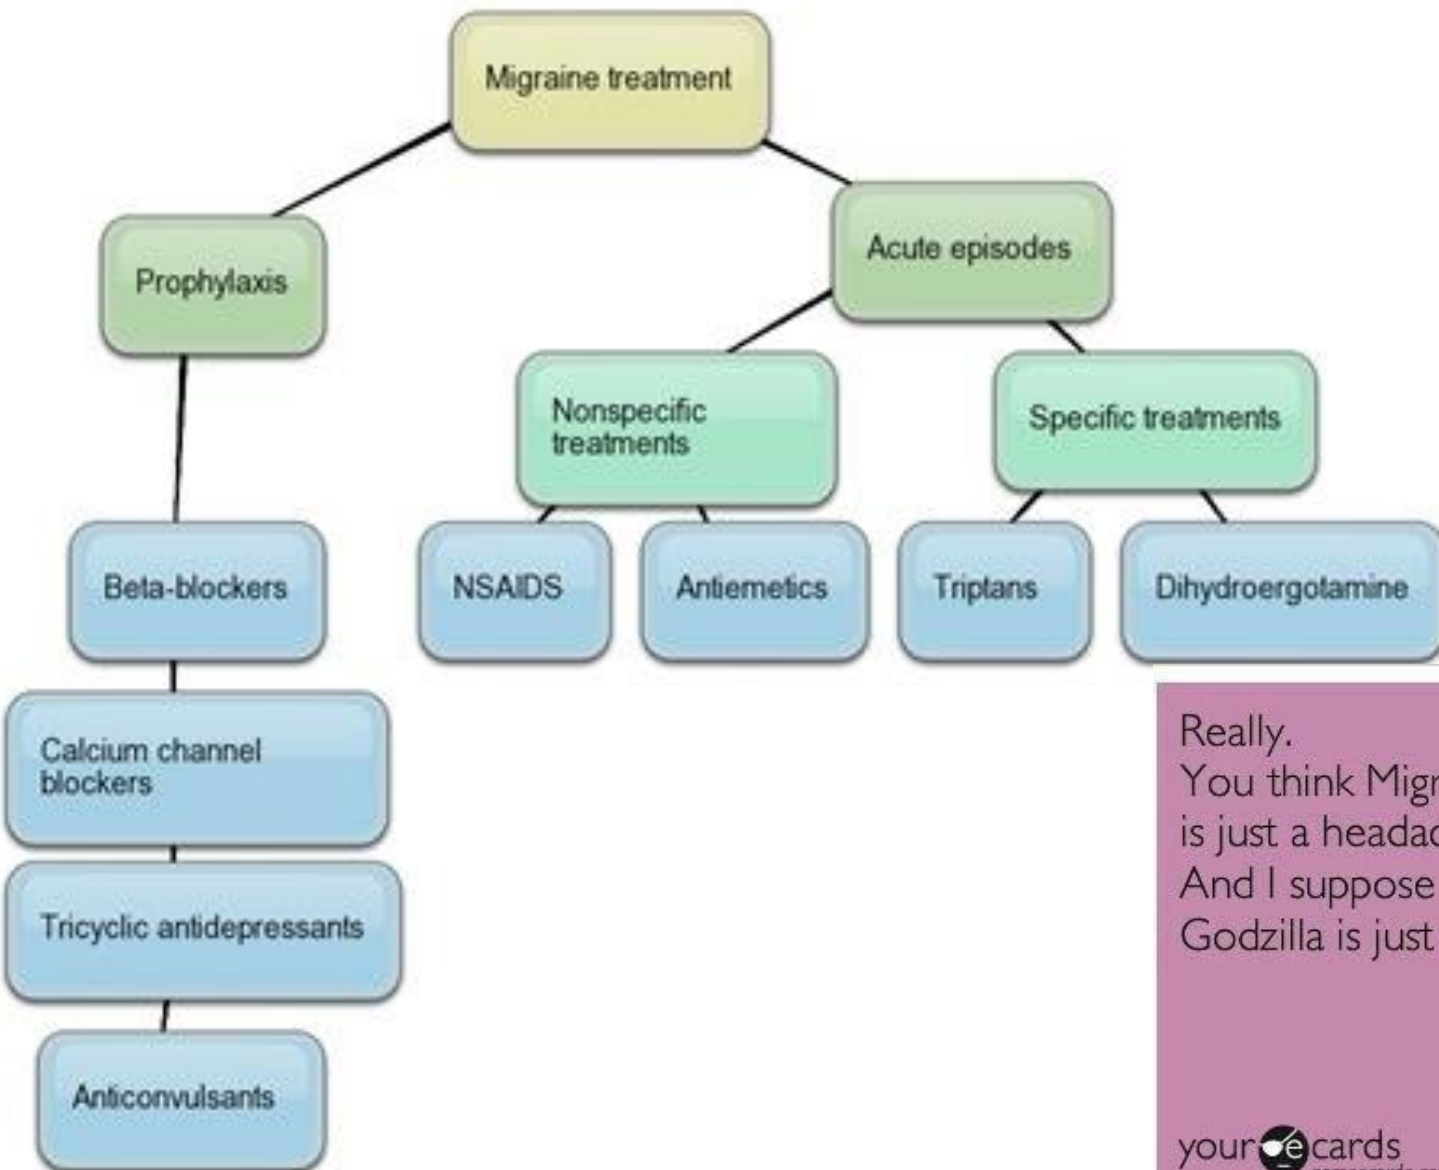

# Migraine

## Mechanisms & symptoms

- inherited, episodic disorder involving **sensory sensitivity**
- patients complain of **discomfort from normal lights** & the **unpleasantness of routine sounds**

# Migraine treatment

Really.  
You think Migraine  
is just a headache?  
And I suppose  
Godzilla is just a lizard?

# 5-HT AGONISTS

## Proposed Mechanisms for Triptan Effect on Migraine

# ***Triptans***

- ***sumatriptan***

- side effects

✚ **5-HT<sub>1D</sub> receptor agonist**

✚ **migraine therapy**

✚ **ergotamine replacement**

Type	Common
CVS	<b>palpitations, syncope, changes in BP</b>
ENT	sinusitis, tinnitus; allergic rhinitis; upper respiratory inflammation; ENT hemorrhage
Neurological	phonophobia & photophobia
Endocrine	thirst
Muscular	myalgia
Urogenital	dysmenorrhea, ↑ urination, intermenstrual bleeding
Eye	mydriasis, blindness & low vision, visual disturbances, eye edema & swelling, eye irritation & itching, accommodation disorders, external ocular muscle disorders

# 5-HT ANTAGONISTS

- ***cyproheptadine***

- + 5-HT-, H-, M- antagonist
- + allergy therapy (insects, food, drugs)
- + **migraine prophylaxis**
- + ↓↓ GIT motility

- ***ketanserine***

- + ↓↓ in thrombocyte aggregation
- + α-receptor inhibition (BP ↓↓)
- + amelioration of rheology – **ulcus cruris & decubitus therapy**

# 5-HT ANTAGONISTS

- *ondansetron, granisetron, tropisetron*

(antagonists of 5-HT<sub>3</sub>-receptor subtype)

- **important antiemetics**  
(chemotherapy, radiotherapy)

- *pizotifen, pipetiaden*
- **migraine prophylaxis**
- sedation
- ↑↑ appetite

**Vomiting girl**

OKSENDAV TÜDRÜK  
1997
